Lecture 9: Exploring BioConductor

- How do we load CEL files into an AffyBatch? how can we merge batches? how can we partition batches?
- How do we check that it worked?
- How do we supply the associated phenoData?
- Given an AffyBatch, how do we look at it? boxplot, hist, ma-plots, ratio plots, PLM
- Given an AffyBatch, how do we fit it? `expresso`, `justRMA`
- Given an `eset`, what can we say about its contents?
- How can we get the probe level values for a probeset?

- How can we figure out what probeset corresponds to a given gene?
- How can we get the probe sequences for a probeset?

Loading CEL files into an AffyBatch

One theme for today is TMTOWTDI. We're going to try to extend this from Perl over to BioConductor, and to the analysis of Affy data.

To begin with, let's say that we've got a set of CEL files. How do we pull them in?

There are several options. How do I survey them?

Loading CEL files into an AffyBatch

One theme for today is TMTOWTDI. We're going to try to extend this from Perl over to BioConductor, and to the analysis of Affy data.

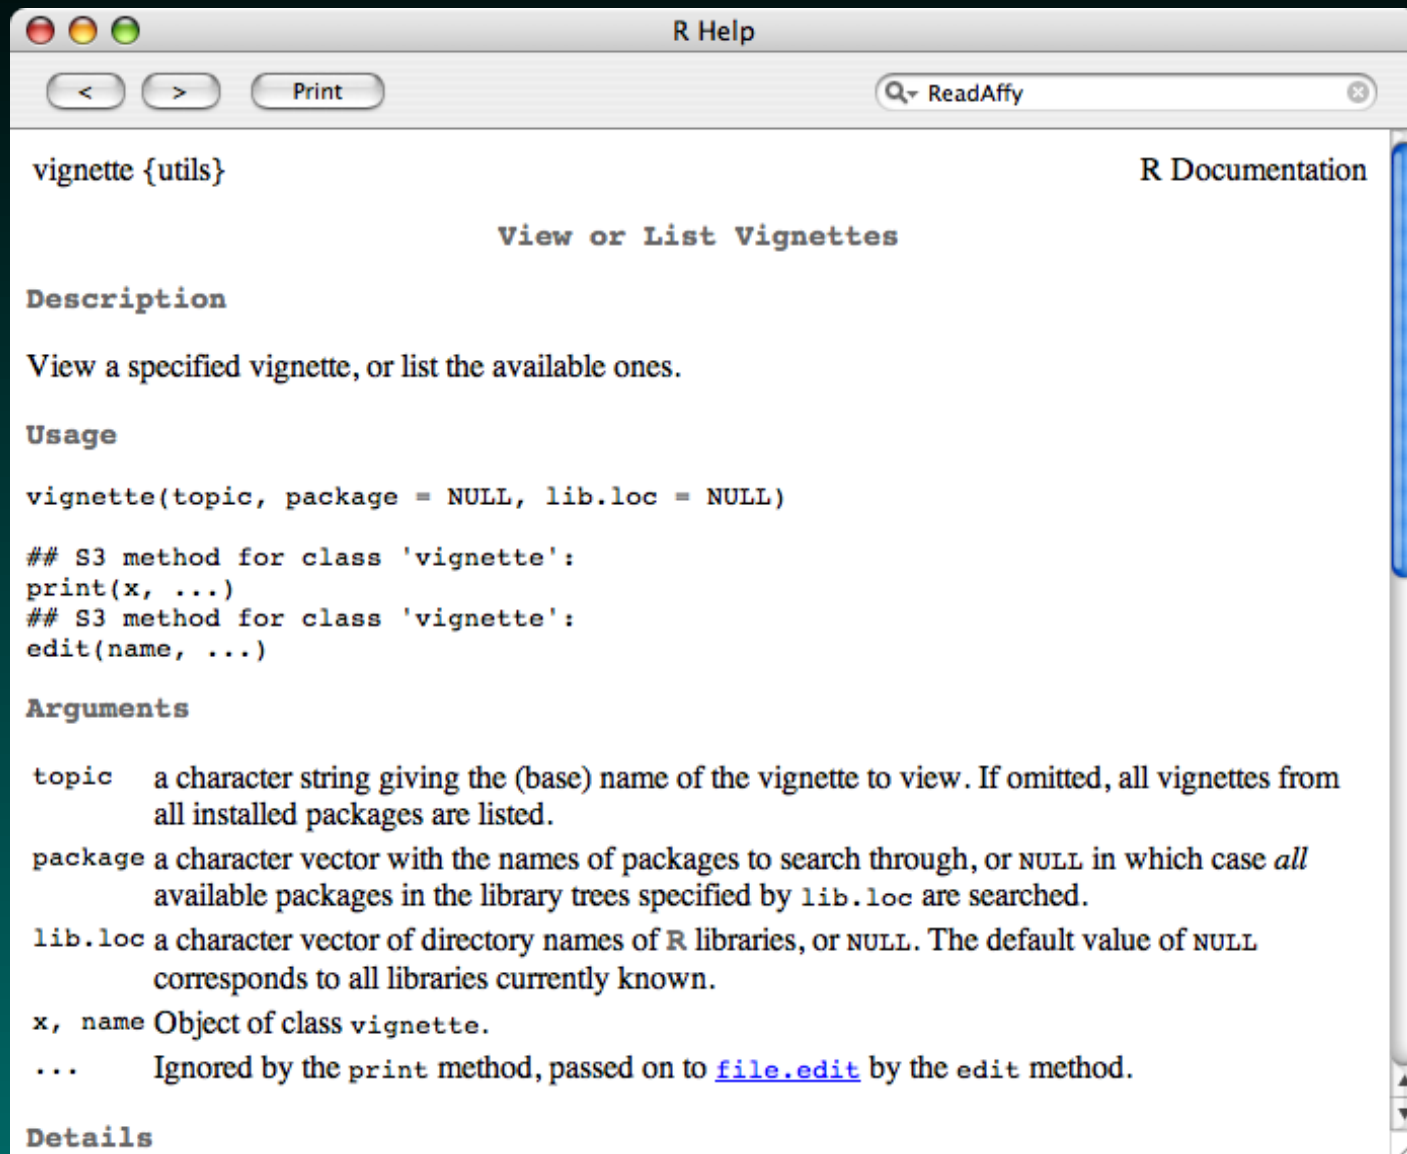

To begin with, let's say that we've got a set of CEL files. How do we pull them in?

There are several options. How do I survey them?

```
> library("affy");  
> vignette("affy");
```

Don't panic, it's not really 271 pages...

Reading the Fine Manual: Vignettes

The screenshot shows a window titled "R Help" with a search bar containing "ReadAffy". The main content area displays the documentation for the "vignette" function from the "utils" package. The documentation includes a description, usage, arguments, and details sections.

vignette {utils} R Documentation

View or List Vignettes

Description

View a specified vignette, or list the available ones.

Usage

```
vignette(topic, package = NULL, lib.loc = NULL)
```

```
## S3 method for class 'vignette':  
print(x, ...)  
## S3 method for class 'vignette':  
edit(name, ...)
```

Arguments

topic a character string giving the (base) name of the vignette to view. If omitted, all vignettes from all installed packages are listed.

package a character vector with the names of packages to search through, or `NULL` in which case *all* available packages in the library trees specified by `lib.loc` are searched.

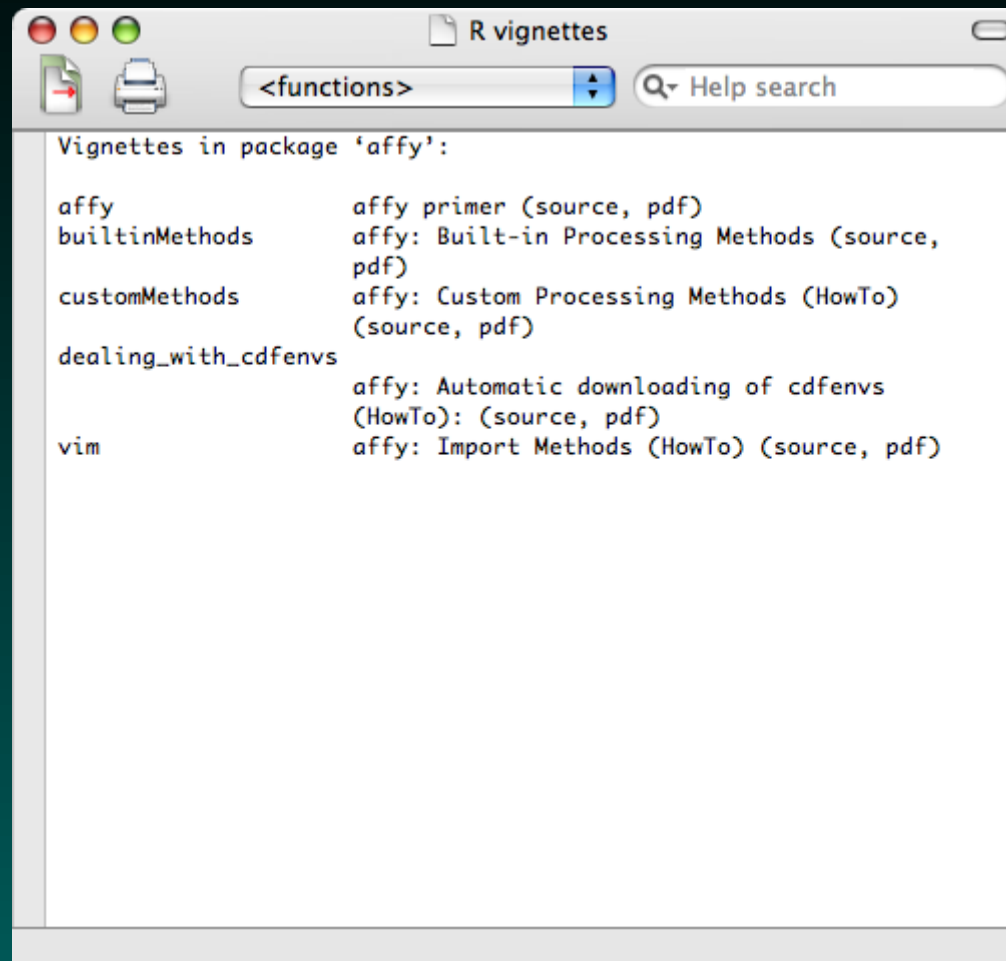

lib.loc a character vector of directory names of R libraries, or `NULL`. The default value of `NULL` corresponds to all libraries currently known.

x, name Object of class `vignette`.

... Ignored by the `print` method, passed on to [file.edit](#) by the `edit` method.

Details

Listing Vignettes

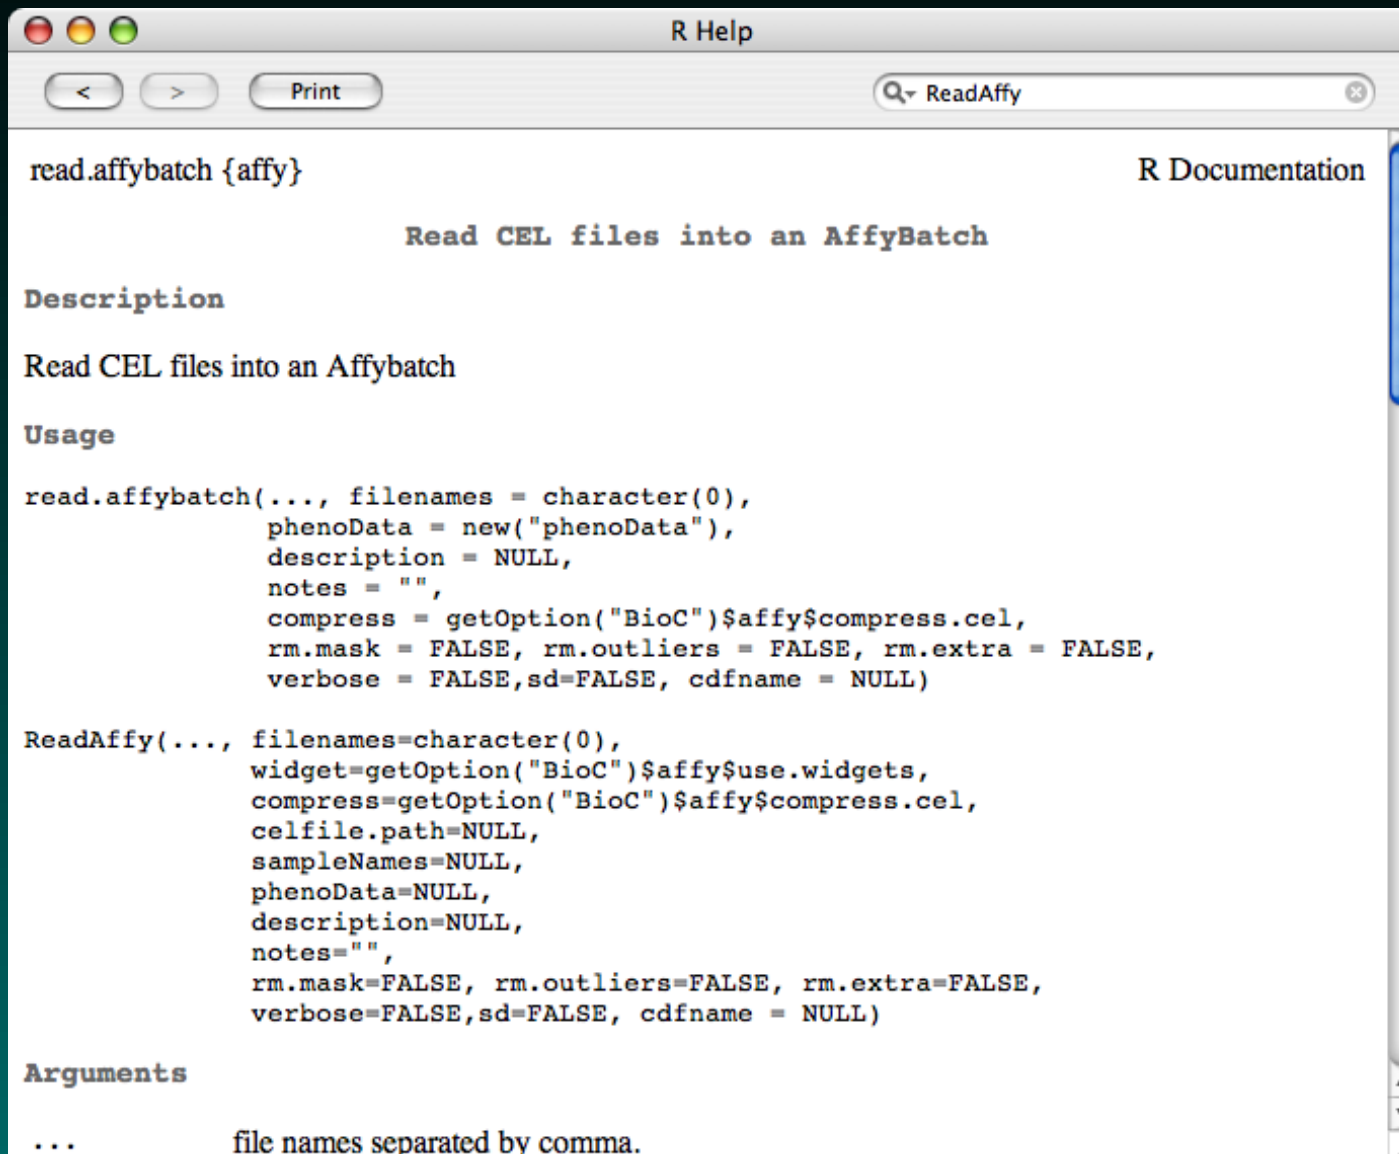

The screenshot shows a window titled "R vignettes" with a search bar containing "<functions>" and a "Help search" button. The main content area displays the following text:

```
Vignettes in package 'affy':  
  
affy                affy primer (source, pdf)  
builtinMethods     affy: Built-in Processing Methods (source,  
pdf)  
customMethods      affy: Custom Processing Methods (HowTo)  
                    (source, pdf)  
dealing_with_cdfenvs  affy: Automatic downloading of cdfenvs  
                    (HowTo): (source, pdf)  
vim                affy: Import Methods (HowTo) (source, pdf)
```

```
> vignette(package = "affy");
```

ReadAffy: Help from Top

The image shows a screenshot of an R Help window titled "R Help". The search bar at the top right contains "ReadAffy". The main content area displays the help text for the `read.affybatch` function. The text is as follows:

```
read.affybatch {affy} R Documentation
```

Read CEL files into an AffyBatch

Description

Read CEL files into an Affybatch

Usage

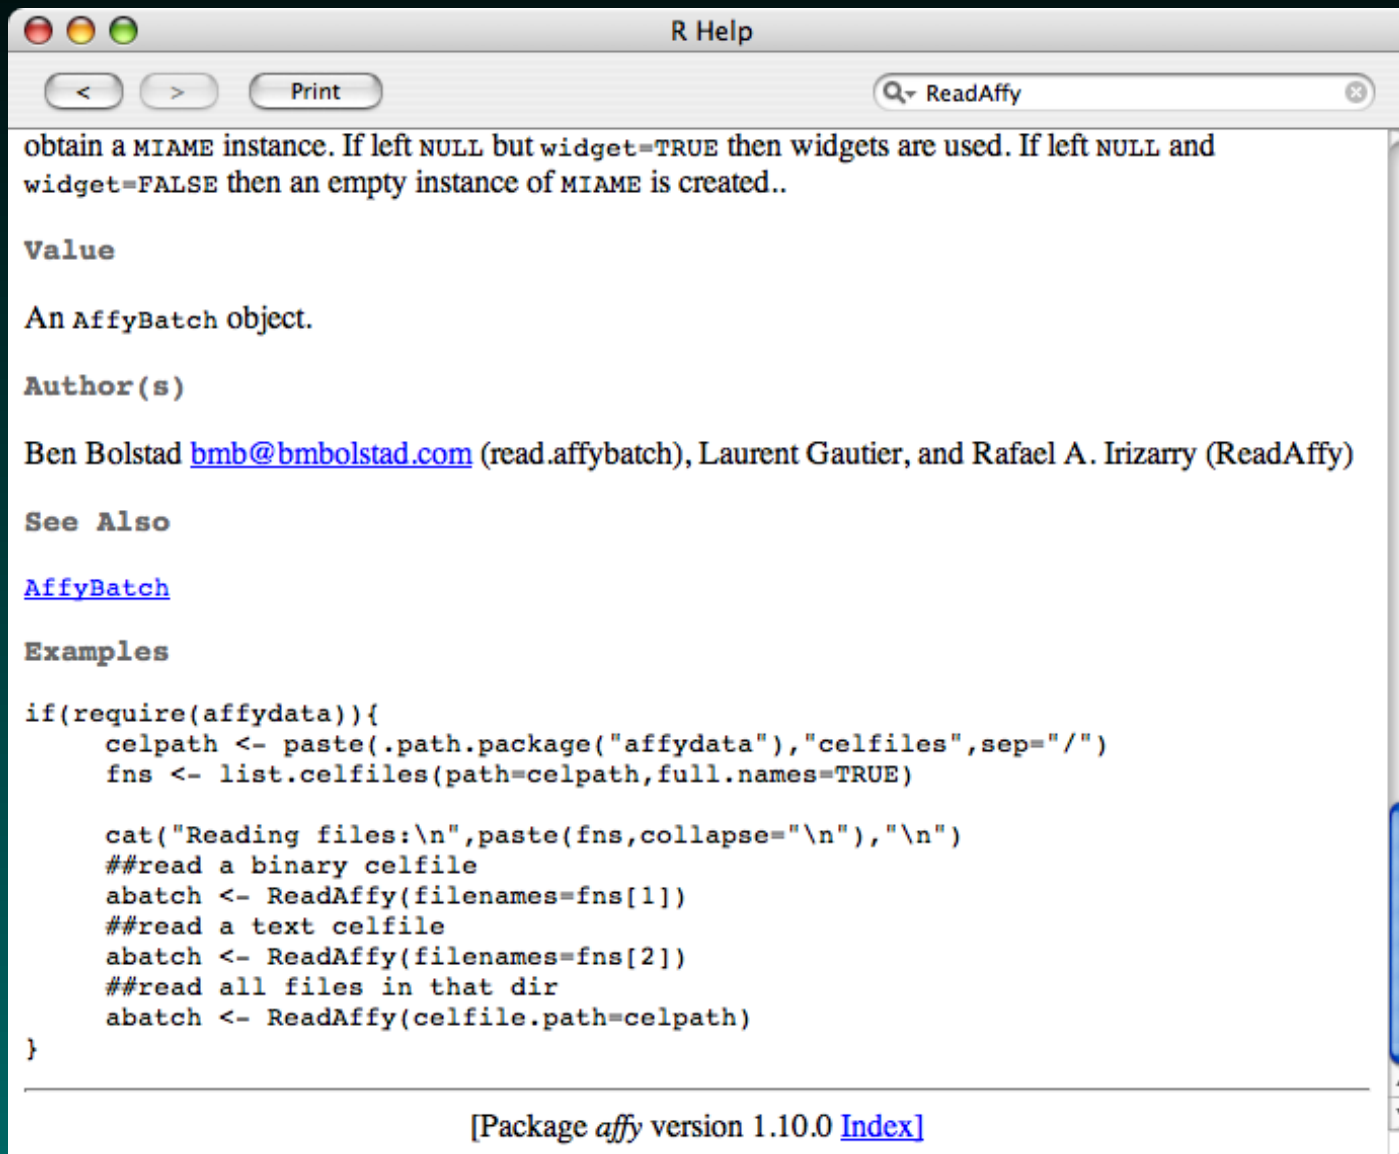

```
read.affybatch(..., filenames = character(0),
               phenoData = new("phenoData"),
               description = NULL,
               notes = "",
               compress = getOption("BioC")$affy$compress.cel,
               rm.mask = FALSE, rm.outliers = FALSE, rm.extra = FALSE,
               verbose = FALSE, sd=FALSE, cdfname = NULL)
```

```
ReadAffy(..., filenames=character(0),
          widget=getOption("BioC")$affy$use.widgets,
          compress=getOption("BioC")$affy$compress.cel,
          celfile.path=NULL,
          sampleNames=NULL,
          phenoData=NULL,
          description=NULL,
          notes="",
          rm.mask=FALSE, rm.outliers=FALSE, rm.extra=FALSE,
          verbose=FALSE, sd=FALSE, cdfname = NULL)
```

Arguments

... file names separated by comma.

ReadAffy: .. to Bottom

The image shows a screenshot of an R Help window titled "R Help". The search bar at the top right contains "ReadAffy". The main content area displays the following text:

obtain a MIAME instance. If left NULL but `widget=TRUE` then widgets are used. If left NULL and `widget=FALSE` then an empty instance of MIAME is created..

Value

An `AffyBatch` object.

Author(s)

Ben Bolstad bmb@bmbolstad.com (`read.affybatch`), Laurent Gautier, and Rafael A. Irizarry (`ReadAffy`)

R documentation: Sweave

The screenshot shows a window titled "R Help" with a search bar containing "Sweave". The main content area displays the documentation for the Sweave package, including sections for Description, Usage, Arguments, and Details.

Sweave {utils} R Documentation

Automatic Generation of Reports

Description

sweave provides a flexible framework for mixing text and S code for automatic report generation. The basic idea is to replace the S code with its output, such that the final document only contains the text and the output of the statistical analysis.

Usage

```
Sweave(file, driver = RweaveLatex(),
       syntax = getOption("SweaveSyntax"), ...)
```

```
Stangle(file, driver = Rstangle(),
        syntax = getOption("SweaveSyntax"), ...)
```

Arguments

file Name of Sweave source file.

driver The actual workhorse, see details below.

syntax An object of class `SweaveSyntax` or a character string with its name. The default installation provides `SweaveSyntaxNoweb` and `SweaveSyntaxLatex`.

... Further arguments passed to the driver's setup function.

Details

Automatic generation of reports by mixing word processing markup (like latex) and S code. The S code is replaced by its output (text or graphics) in the final markup file. This allows to generate a report if

> ABatch <- ReadAffy(filenamees = cellList);
```

Ta Da!

Checking the Contents

```
> slotNames (ABatch)
[1] "cdfName"      "nrow"      "ncol"
[5] "se.exprs"     "description" "annotation"
[9] "reporterInfo" "phenoData"
```

```
> phenoData (ABatch)
phenoData object with 1 variables and 6 cases
varLabels
sample: arbitrary numbering
```

Looking at phenoData

```
> slotNames(phenoData(ABatch))
[1] "pData"      "varLabels"  "varMetadata"
> (phenoData(ABatch))@pData
      sample
N01__normal.CEL      1
N05__normal.CEL      2
N11__normal.CEL      3
N15__normal.CEL      4
N21__normal.CEL      5
N25__normal.CEL      6
> (phenoData(ABatch))@varLabels
$sample
[1] "arbitrary numbering"
```

Assigning phenoData

some_pdata.txt:

Sample name	Concocted
N01_norm	A
N05_norm	A
N11_norm	A
N15_borm	B
N21_borm	B
N25_borm	B

```
> p1 <- read.phenoData("some_pdata.txt");# error
```

Assigning phenoData, pt 2

```
> p1 <- read.phenoData("some_pdata.txt",  
                      sep="\t")  
  
> p1  
phenoData object with 2 variables  
and 7 cases  
  
varLabels  
V1: read from file  
V2: read from file  
# Not quite what we want.
```

Assigning phenoData, pt 3

```
> p1 <- read.phenoData("some_pdata.txt",  
                      sep="\t", header=TRUE)  
  
> p1  
phenoData object with 2 variables  
and 6 cases  
  
varLabels  
Sample.name: read from file  
Concocted: read from file  
  
> phenoData(ABatch) <- p1
```

Other ways of Reading Data

Are they all in one directory?

What is the list of filenames?

read.affybatch vs ReadAffy

GUI?

Other ways of Reading Data 1

```
kabagg$ ls ../../DataSets/SinghSmall
N60__normal.CEL N61__normal.CEL N62__normal.CEL

> ABSmall <- ReadAffy(cefile.path=
  "../../DataSets/SinghSmall"); # works
```

Other ways of Reading Data 2

```
kabagg$ ls ../../DataSets/SinghSmall2  
N60__normal.CEL.gz N61__normal.CEL.gz  
N62__normal.CEL.gz
```

```
> ABSmall <- ReadAffy(cefile.path=  
  "../../DataSets/SinghSmall2",  
  compress=TRUE); # works
```

This takes only about 1/3 the space...

Other ways of Reading Data 3

```
kabagg$ ls ../../DataSets/SinghSmall3  
N60.gz N61.gz N62.gz
```

```
> ABSmall <- ReadAffy(celfile.path=  
  "../../DataSets/SinghSmall3",  
  compress=TRUE); # fails
```

```
> ABSmall <- ReadAffy(filenamees=  
  "../../DataSets/SinghSmall3/N60.gz",  
  compress=TRUE); # works
```

This still takes only about 1/3 the space...

Now let's Quantify

```
t0 <- date();
eset0 <- expresso(ABatch,
                  bgcorrect.method="rma",
                  normalize.method="quantiles",
                  pmcorrect.method="pmonly",
                  summary.method="medianpolish");

t1 <- date(); # 151s
eset1 <- justRMA(filenamees = cellList);
t2 <- date(); # 10s
```

The customized routines are better if they do what you want to do...

(also note that justRMA didn't build an AffyBatch.)

Just Because I'm Curious

```
> exprs(eset1)[1,]
N01__normal.CEL N05__normal.CEL N11__normal.CEL
      7.789481      7.314639      7.445363
N15__normal.CEL N21__normal.CEL N25__normal.CEL
      7.289881      7.503692      7.412608
```

Can we reconstruct this?

```
> ABatch.BG <- bg.correct.rma(ABatch)
> ABatch.BG.norm <-
  normalize.AffyBatch.quantiles(ABatch.BG)
```

These steps produce AffyBatch objects, with altered exprs.

What is the First Gene?

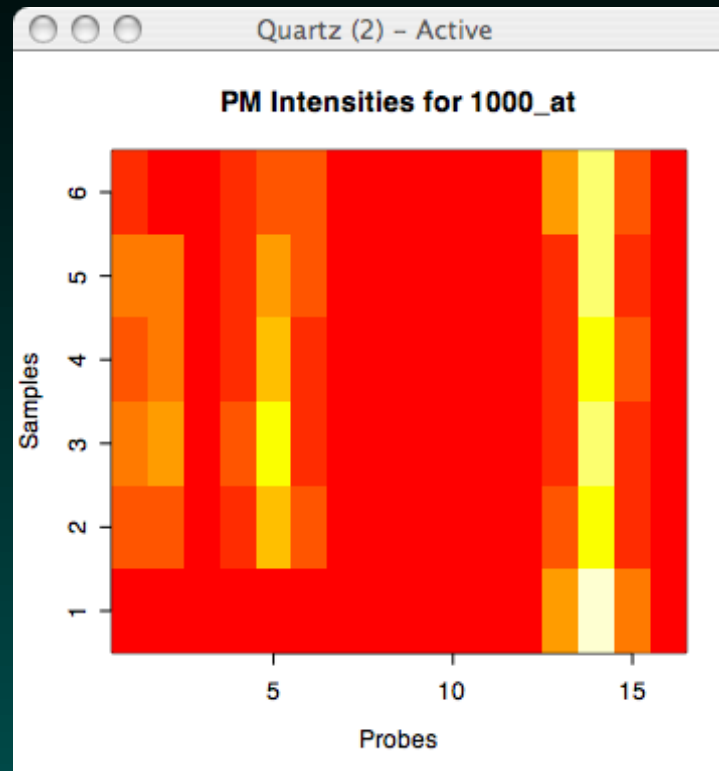

(well, ok, probeset)

```
> gn1 <- geneNames(ABatch.BG.norm) [1]
> gn1
[1] "1000_at"
```

Ok, now what are the values?

```
pr1 <- pm(ABatch.BG.norm, gn1);
```

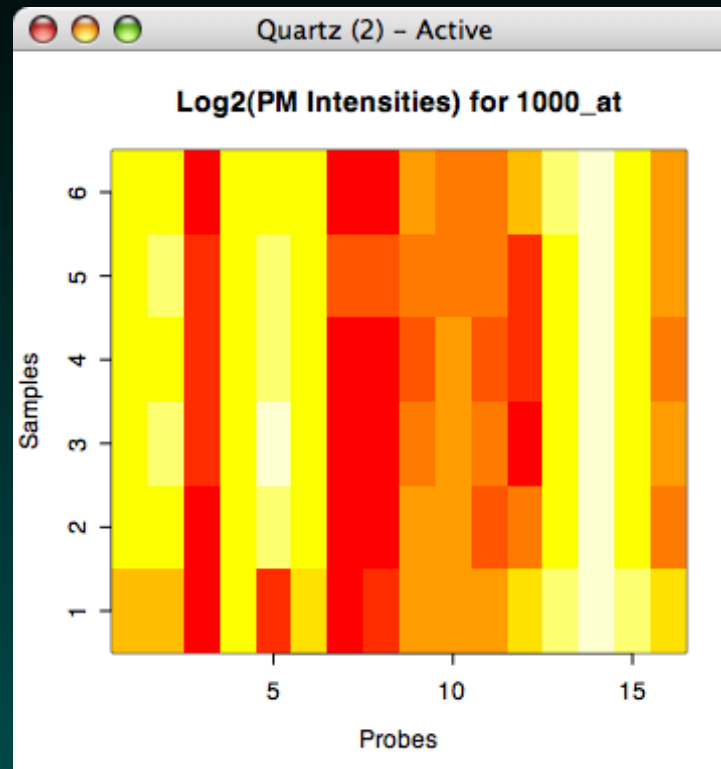

Looking at it, Take 1

```
image(1:nrow(pr1), 1:ncol(pr1), pr1,  
      xlab="Probes", ylab="Samples",  
      main="PM Intensities for 1000_at")
```

Some parallelism, but we may be missing something...

Looking at it, Take 2

```
image(1:nrow(pr1), 1:ncol(pr1), log2(pr1),  
      xlab="Probes", ylab="Samples",  
      main="Log2(PM Intensities) for 1000_at")
```

Logs!

Fitting the Probes

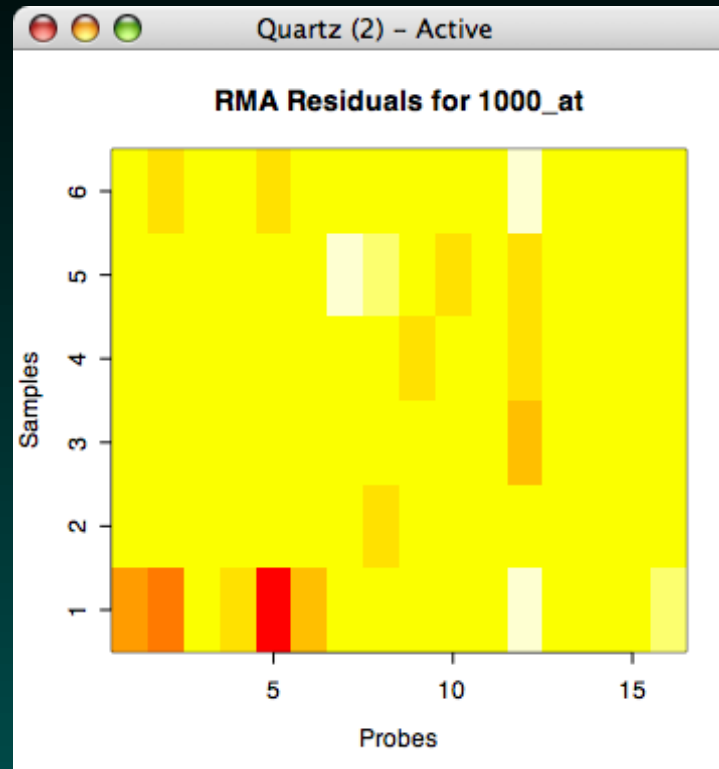

```
> pr1Fit <- medpolish(log2(pr1))
1 : 45.72612
2 : 45.08797
Final: 45.03615
> names(pr1Fit)
[1] "overall" "row" "col" "residuals"
[5] "name"
> pr1Fit$overall + pr1Fit$col
N01__normal.CEL N05__normal.CEL N11__normal.CEL
      7.789481      7.314639      7.445363
N15__normal.CEL N21__normal.CEL N25__normal.CEL
      7.289881      7.503692      7.412608
```

This is what we found before!

We can Check the Code

```
> medpolish
function (x, eps = 0.01, maxiter = 10,
        trace.iter = TRUE, na.rm = FALSE)
{
  z <- as.matrix(x)
  nr <- nrow(z)
  nc <- ncol(z)
  t <- 0
  r <- numeric(nr)
  c <- numeric(nc)
  oldsum <- 0
  for (iter in 1:maxiter) {
    rdelta <- apply(z, 1, median, na.rm = na.rm)
    z <- z - matrix(rdelta, nr = nr, nc = nc)
```

and Check the Residuals

```
image(1:nrow(pr1), 1:ncol(pr1), pr1Fit$residuals,  
      xlab="Probes", ylab="Samples",  
      main="RMA Residuals for 1000_at")
```

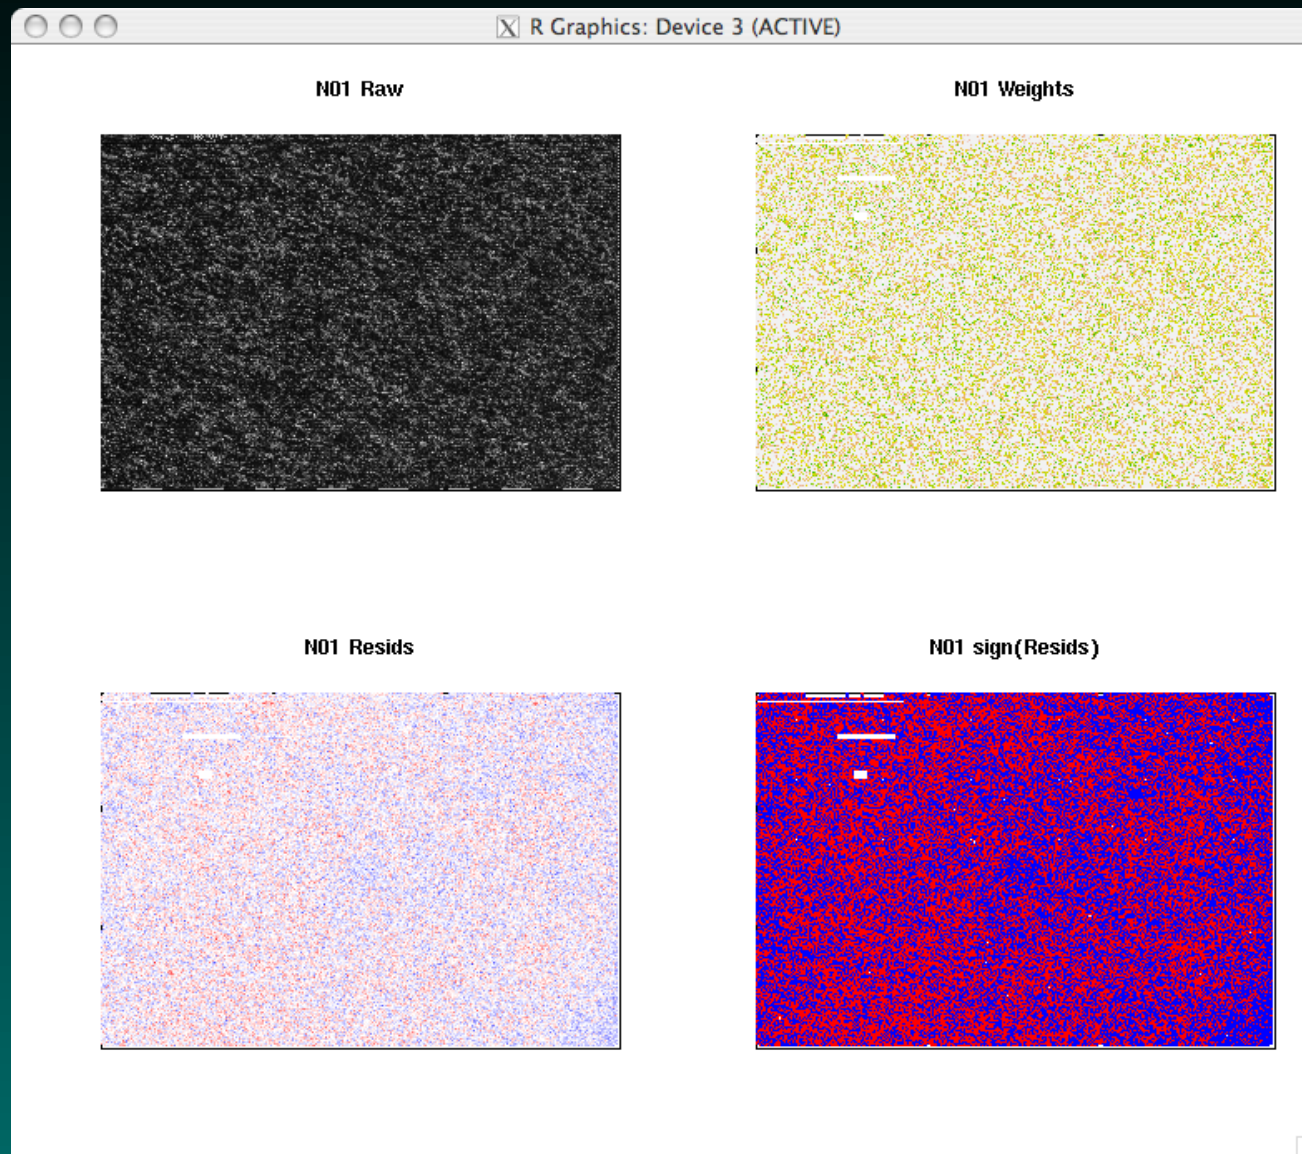

Trivia Q: Who introduced median polish?

One other Fitting Approach: PLM

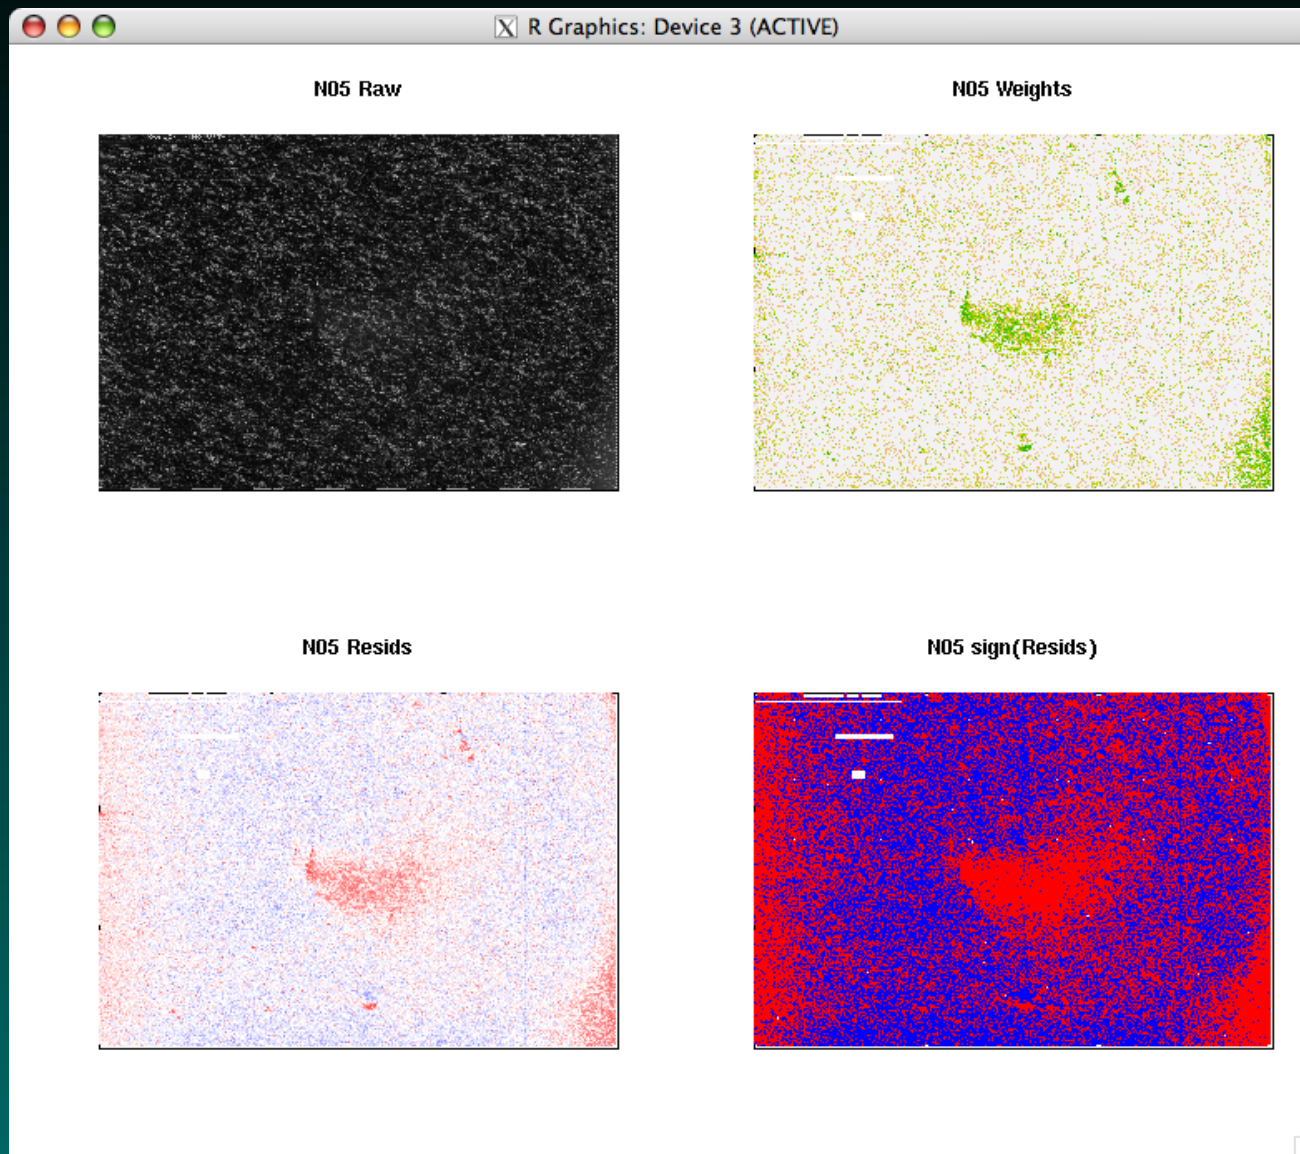

PLM = “Probe Level Model”

```
library("affyPLM");  
plm1 <- fitPLM(ABatch); # takes a few minutes  
par(mfrow=c(2,2));  
image(ABatch[, 1], main="N01 Raw");  
image(plm1, type="weights", which=1, main="N01 We");  
image(plm1, type="resids", which=1, main="N01 Res");  
image(plm1, type="sign.resids", which=1,  
       main="N01 sign(Resids)");
```

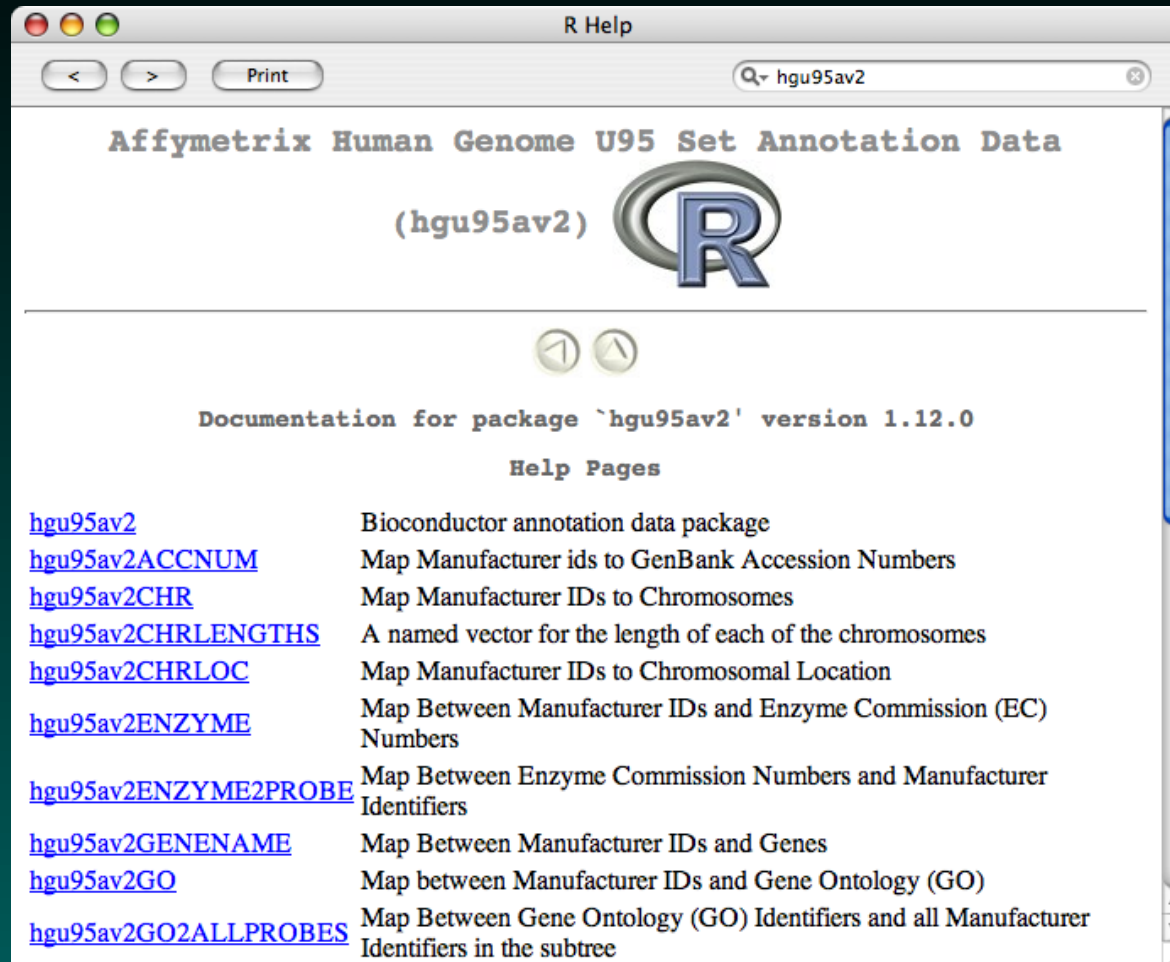

Looking at N01

Looking at N05

Whence the Gene Name Info?

The screenshot shows the R Help window for the `hgu95av2` package. The window title is "R Help" and the search bar contains "hgu95av2". The main heading is "Affymetrix Human Genome U95 Set Annotation Data (hgu95av2)" with the R logo. Below this, it says "Documentation for package 'hgu95av2' version 1.12.0" and "Help Pages". A list of help pages is shown, each with a blue underlined link and a description:

Link	Description
hgu95av2	Bioconductor annotation data package
hgu95av2ACCNUM	Map Manufacturer ids to GenBank Accession Numbers
hgu95av2CHR	Map Manufacturer IDs to Chromosomes
hgu95av2CHRLNGTHS	A named vector for the length of each of the chromosomes
hgu95av2CHRLOC	Map Manufacturer IDs to Chromosomal Location
hgu95av2ENZYME	Map Between Manufacturer IDs and Enzyme Commission (EC) Numbers
hgu95av2ENZYME2PROBE	Map Between Enzyme Commission Numbers and Manufacturer Identifiers
hgu95av2GENENAME	Map Between Manufacturer IDs and Genes
hgu95av2GO	Map between Manufacturer IDs and Gene Ontology (GO)
hgu95av2GO2ALLPROBES	Map Between Gene Ontology (GO) Identifiers and all Manufacturer Identifiers in the subtree

```
> library("hgu95av2");
```

What Does This Package Contain?

```
> hgu95av2()
```

hgu95av2PROSITE found 8193
```

(we can also see this using `ls("package:hgu95av2")`.)

What Does This Package Contain?

```
> hgu95av2GENENAME  
<environment: 0x26519bdc>
```

Almost everything in this package is an “environment”, which is R’s fancy name for a hash table. We can access things by name.

```
> hgu95av2GENENAME$"1000_at"  
[1] "mitogen-activated protein kinase 3"
```

We can access a lot of annotation!

What was Needed for Quantification?

```
> library("hgu95av2cdf");  
> hgu95av2cdf$"1000_at"
```

```
      pm      mm  
[1, ] 358160 358800  
[2, ] 118945 119585  
[3, ] 323731 324371  
[4, ] 223978 224618  
...  
[15, ] 317054 317694  
[16, ] 404069 404709
```

These give the indices of the probes within the 409600-long vector of expression intensities.

What if We Want to Go in Reverse?

Given a probeset, I can find a gene name. What if I have a gene name, and I want something else?

Can we find “BAD”?

This is a gene symbol, so we probably want to work with the `hgu95av2SYMBOL` environment.

The key function for extracting items from an environment without the key is “`contents`”.

```
> tempSYM <- contents(hgu95av2SYMBOL);  
> tempSYM[1]  
$ `986_at`  
[1] "CYP19A1"
```

Finding BAD in the Contents

```
> tempSYM[tempSYM == "BAD"]
```

```
$ `1861_at`
```

```
[1] "BAD"
```

```
> names(tempSYM[tempSYM == "BAD"])
```

```
[1] "1861_at"
```

This gives us the key!

Some of these queries are simplified if we invoke

```
> library("annotate"); # for example,
```

```
> getLL("1861_at", "hgu95av2");
```

```
[1] 572
```

One More Thing...

sequences?

```
> library("hgu95av2probe");  
> data(hgu95av2probe); # a big file
```

```
> as.data.frame(hgu95av2probe[1,])  
              sequence      x      y  
1 TCTCCTTTGCTGAGGCCTCCAGCTT 399 559
```

```
Probe.Set.Name      Probe.Interrogation.Position  
1000_at              1367
```

```
Target.Strandedness  
Antisense
```

So, What's BAD?

```
> as.data.frame(hgu95av2probe[hgu95av2probe$Probe
                sequence      x      y Probe.Set
14006 CAACCTCTGGGCAGCACAGCGCTAT 403 485      18
14007 AACCTCTGGGCAGCACAGCGCTATG 402 485      18
14008 CCTCTGGGCAGCACAGCGCTATGGC 207 491      18
14009 TGGGCAGCACAGCGCTATGGCCGCG 436 421      18
14010 GCAGCACAGCGCTATGGCCGCGAGC 285 599      18
...
```

The midpoint of the first probe should be at position 384 within the cDNA sequence.
