#### Lecture 2: The Basics of dChip

- So, why are we here?
- Getting the stuff required
- Using dChip
  - Loading Data
  - Looking at Data
  - Normalizing Data
  - Model Fitting
  - Exporting Results
- The Real World...

#### So, why are we here?

We want to learn about dChip.

The freeware package dChip has become quite widely used for the analysis of Affymetrix gene chip data. We're going to look at using it now.

The main web page for dChip is

http://biosun1.harvard.edu/complab/dchip/

where you can download the software, get links to some publicly available data, and browse through the online manual.

Much of this lecture will follow the manual, and the associated "Short tutorial" and "Lab" with my editorial comments.

#### Step 1: Get dChip

This step is fairly trival; simply download the latest version (dchip2004.exe as of July 13, 2005) and put the application somewhere (eg, D:Program Files/dChip2004/). We keep this application on a shared drive at

/data/bioinfo/affymetrix/00 Affymetrix Info/DChip Files

The entire application is a bit over 1M in size. At present, dChip only runs on Windows platforms. Some success has been reported using windows emulators on the Mac, but there is a performance hit.

#### A Biological Example

There is a genetic translocation that occurs in ALL, associated with a mixed-lineage leukemia gene (MLL). Patients with this translocation have noticably worse outcomes. It is thought that this translocation may make the disease qualitatively different, and somewhat closer to AML. If the disease is different, we may want to adjust the therapy as well.

Using Affymetrix gene chips, can we identify differences between ALL, MLL, and AML?

### **Step 2: Get CEL Files**

The Lab page supplies a link to the example data CEL files on leukemia (ALL,MLL,AML) from Dana Farber.

```
http://www.broad.mit.edu/cgi-bin/cancer/
publications/pub_paper.cgi?mode=view&paper_id=63
```

The CEL files are available as gzipped tar files, which WinZip should be able to uncompress. There are 6 CEL file collections at this site, each about 35-41M in size, or 100-127M in size when uncompressed. These files contain about 10-12 CEL files each.

The suffixes on these files should be .tar.gz, but for some reason they are tar.tar. This latter suffix needs to be changed so that the file type will be recognized.

#### Step 2: Get CEL Files (cont)

If you are working with CEL files stored in more than one location, it is often useful to assemble a "data list file" specifying the locations of the files. This file should be a text file (and end in .txt). Every row should contain either a specific file name or a directory. An example from the manual:

```
E:\Affy data\dan\CA-H.cel
E:\Affy data\dan\CA-HR.cel
E:\Affy data\dan\zugen
E:\Affy data\dan\PC-C.cel
```

Here, the AML samples were run later, so we put them in a different directory.

#### **Step 2A: Digression**

The Dana Farber web site also supplies the quantifications that they used in their analyses, as

expression\_data.txt

or

expression\_data\_plus\_APcalls.txt

These data were initially quantified using MAS4.0 (AvDiff). We prefer to work with the CEL files as raw data and to construct our own quantifications.

## **Step 3: Get Explanatory Files**

Also at the above site, there are files describing the sample-to-chip mapping in more detail:

scaling\_factors\_and\_fig\_key.txt

and a link to the paper that appeared in Nature Genetics describing the biological context of the problem.

#### **Step 4: Find the CDF file**

This requires that we know what type of Affy chip was used. In this case (according to the paper), the chips were U95A.

For this example, a compressed version of the CDF file can be downloaded from the dChip site; more generally, we have a collection of CDF files for the chip types we use in

data/bioinfo/affymetrix/00 Affymetrix Info/CDF Files

A warning – the cdf extension is also used for "channel files" by Microsoft, so don't worry if you see a weird icon.

#### **Step 4A: Digression**

Actually, the CDF file for these chips is a bit tricky.

There is a set of U95 chips, U95A,U95B,..,U95E that contain probes for all genes in the genome. The probes were assembled using the 95th build of the Unigene database to define what a "gene" was. However, while these chips surveyed the genome, most of the probes corresponding to "interesting" genes were put on the A chip, so most people just bought those as opposed to the set.

Soon after the U95A release, some mistakes were noted in the probe design, and Affy released the U95Av2, which is the type we have encountered more frequently here at MDA.

Can you tell them apart?

## Step 5: Get the Gene Info file(s)

Every chip type has a fixed set of probesets printed on it, but the probeset identifiers are typically not enough to suggest anything (1389\_at?). We need more context – is there a common name for the associated gene? Which chromosome is it on, and where? Is the gene known or thought to be part of a functional family (eg, cytoskeleton)? Are there IDs that can let us look up more information in national databases?

The above information for each chip type has been collected and assembled into GeneInfo files available at the dChip website.

These files are tab-delimited text files, but they've had an xls extension placed on them so that Excel is the default program for opening them.

These info files can change over time!

## Step 5: Get the Gene Info file(s) (cont)

Actually, when we download the zip file from the dChip web site, we get 3 files:

HG-U95Av2 gene info2.xls

HG-U95Av2 gene info2 Gene Ontology.xls

HG-U95Av2 gene info2 Protein Domain.xls

We're going to look at each of these in turn, but I want to quickly note that these files are for the U95Av2 chip, as opposed to the U95A chip. In terms of the probesets that were used, the overlap is so large (12600 of 12625) that working with these should be fine.

These files are on our system in

/data/bioinfo/affymetrix/00 Affymetrix Info/DChip Files

#### **HG-U95Av2** gene info2.xls

#### The first few entries:

```
Probe Set Name : Identifier : LocusLink :

```

"what ghastly names they all have..." E. J. (Ernest John) Moncrieff

#### **Step 6: Get the Sample Info file**

Most of the files that we have worked with so far have described properties associated with a given chip type, not with the samples we have used. We can also supply and use sample-specific information in a tab-delimited text file. The first few entries here:

scan name	sample_:	name	type
CL2001011101AA	ALL_1	A	
CL2001011104AA	ALL_2	A	
CL2001011105AA	ALL_3	A	
CL2001011108AA	ALL_4	A	
CL2001011109AA	ALL_5	A	
CL2001011111AA	ALL_6	A	
CL2001011112AA	ALL_7	A	
CL2001011116AA	ALL_8	A	
CL2001011113AA	ALL_9	A	

## **Step 6: Get the Sample Info file (cont)**

The header row and the first two columns are required, but any columns beyond that are at our discretion. By default, column values are treated as factors, but adding the string "(numeric)" to a column name will override this.

What else could we have included?

- Presence/absence of other translocations
- train/test status
- specimen type (diagnostic, relapse)
- run date...

#### **Step 7: write a README file**

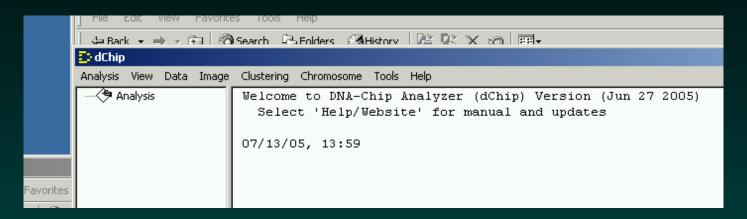

Strictly speaking, this is not mentioned in the Lab or Tutorial, but I'll put it here, right before actually running the program.

What is the biological question you are seeking to address?
What contrasts of data samples will allow you to address this?

Sending a brief description of this type off to the investigator before running the analysis can save some time...

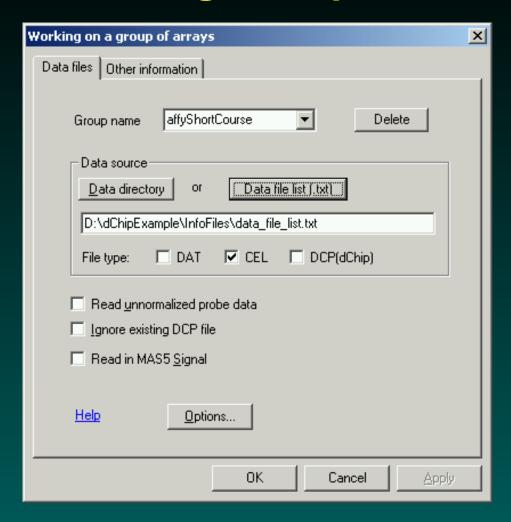

## Step 8: run dChip

Nice, friendly, unexciting...

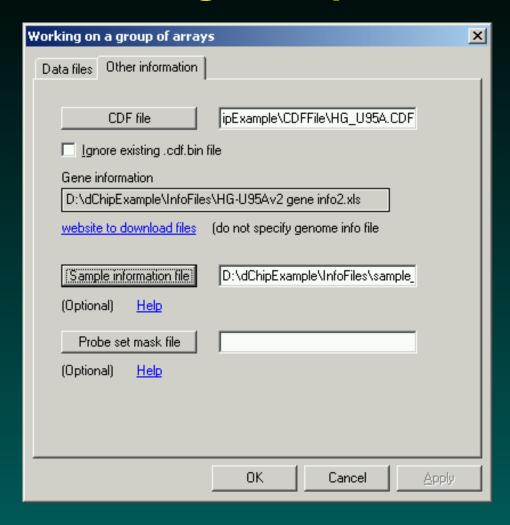

Now, we need to tell it where to find the data for analysis. Go to Analysis/Open Group.

## Finding files, part 1

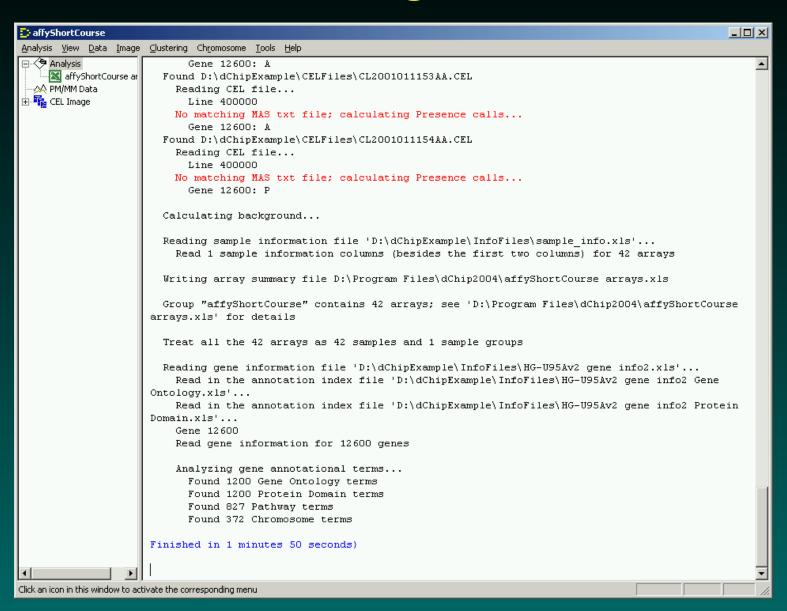

assign a group name, locate data files

#### Finding files, part 2

locate CDF, gene info, and sample info files. Under Options, we can set the working directory where results should be stored.

#### Reading files

#### What has been wrought?

For each CEL file, a binary "dcp" file has been produced:

```
CL2001011101AA.CEL 10,393 KB CL2001011101AA.dcp 1,764 KB CL2001011102AA.CEL 10,324 KB CL2001011102AA.dcp 1,764 KB (2*640^2)*2=1638400
```

Keep the means as 16-bit integers, and allocate space for 2 CEL equivalents in each dcp file – 1 for the raw data, and 1 for the processed data.

This saves space, and uses an intelligent data structure.

## What has been wrought?

A binary version of the CDF file has been produced for quicker processing.

#### What has been wrought?

3 interim files have been produced:

dChip.ini
affyShortCourse.ini
affyShortCourse arrays.xls

The first two are configuration files, and are stored with the exe file. The last summarizes some aspects of the files examined, and is stored in the working directory.

#### The dChip.ini file

#### dChip.ini

```
CDF_FILE=
READ_DAT=0
READ_CEL=1
READ_DCP=0
DATA_PATH=D:\Program Files\dChip2004
WORKING_DIR=D:\Program Files\dChip2004
GOSURFER_DIR=D:\Program Files\dChip2004
USE_UNNORM=0
MAS5_SIGNAL=0
```

#### The affyShortCourse.ini file

#### affyShortCourse.ini

```
CDF_FILE=D:\dChipExample\CDFFile\HG_U95A.CDF
READ_DAT=0
READ_CEL=1
READ_DCP=0
DATA_PATH=D:\dChipExample\InfoFiles\data_file_list.tx
WORKING_DIR=D:\Program Files\dChip2004
GOSURFER_DIR=D:\Program Files\dChip2004
USE_UNNORM=0
MAS5_SIGNAL=0
```

## The affyShortCourse arrays.xls file

#### affyShortCourse arrays.xls

```
Number : Array : File Name : Median Intensity
  (unnormalized) : P call %

1 : ALL_1 : D:\dChipExample\CELFiles\
   CL2001011101AA.CEL : 1497 : 48.2

2 : ALL_24 : D:\dChipExample\CELFiles\
   CL2001011102AA.CEL : 1196 : 38.3

3 : ALL_2 : D:\dChipExample\CELFiles\
   CL2001011104AA.CEL : 1778 : 49.5

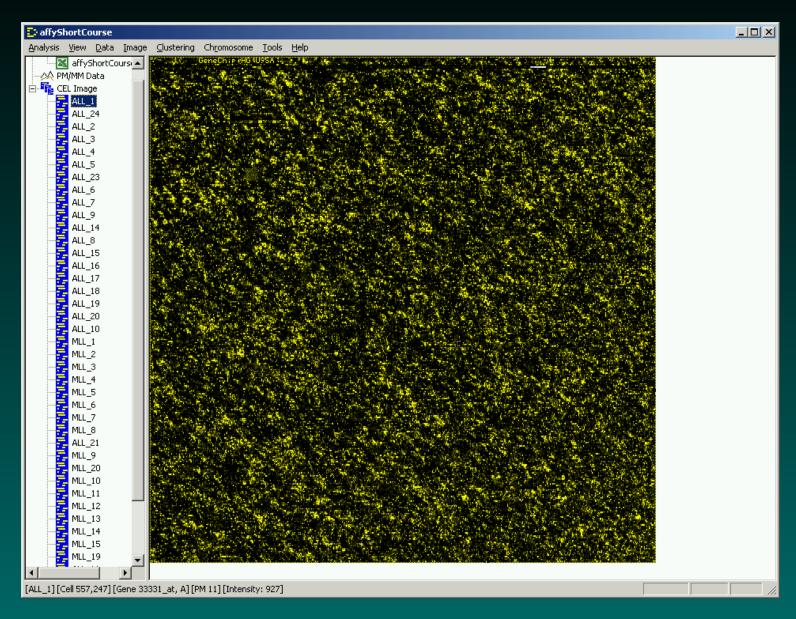

4 : ALL_3 : D:\dChipExample\CELFiles\
   CL2001011105AA.CEL : 1097 : 36.8
```

#### Look at the Chips

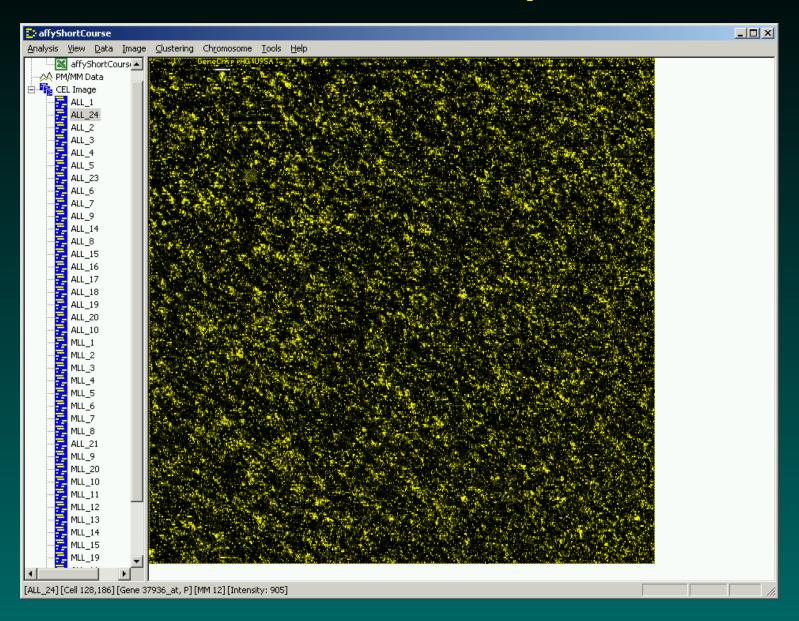

The "Short Tutorial" next suggests going to "View/CEL Image" to look at the data. Unfortunately, this is for an earlier version of dChip, as this pulldown option no longer exists.

So, we click on the "CEL Image" icon at the left of the display and cycle through. If you click on one of the file names, the up and down arrows will let you cycle through them, or Page Up/Page Down also works. The display range covers from the 1st percentile (black) to the 95th (bright yellow).

## Look at the First Chip: ALL\_1

# Look at the Second Chip: ALL\_24

#### **Zoom In**

If you click on a part of the image, you select the corresponding probe set. The arrow keys will let you zoom in on the image to look at that spots more closely.

Down arrow: zoom in lots

Up arrow: zoom out lots

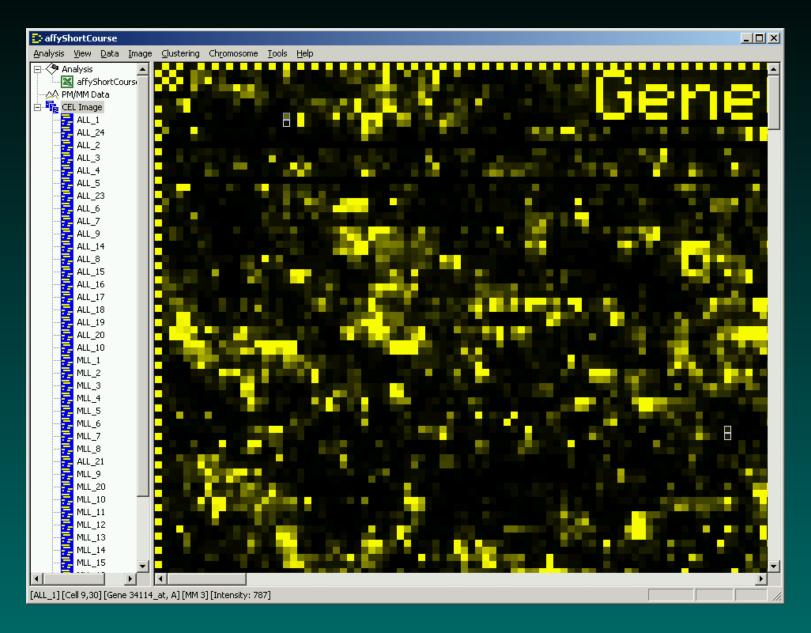

Right arrow: zoom in a little

Left arrow: zoom out a little

Scrollbars move about

Page Up and Page Down cycle you through the set of chips.

#### **Zoom In: ALL\_1**

#### Normalize the data

go to Analysis/Normalize

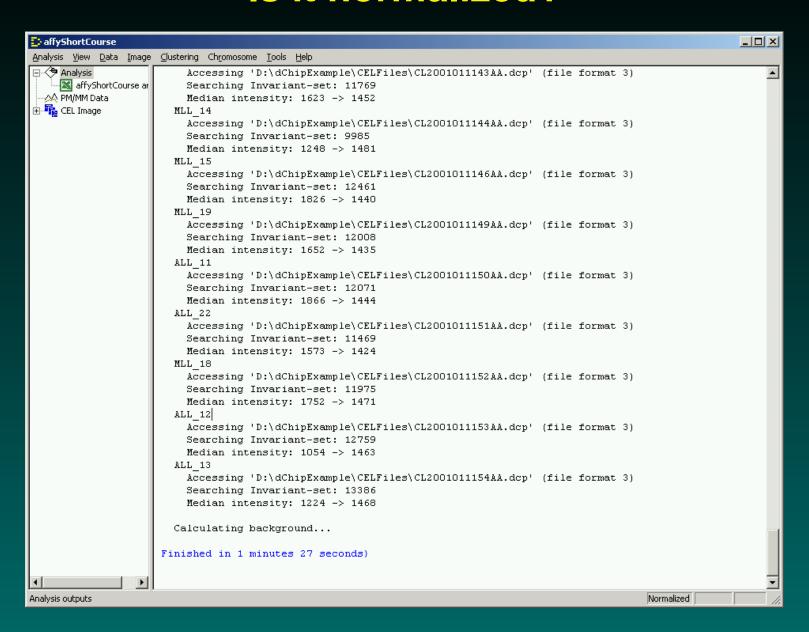

dChip will pick one array in the set to normalize all of the others to; by default it will choose the array with the median overall feature intensity.

(This can make a difference. Trying it with at least two different chips is recommended.)

For each chip, dChip then calculates an "invariant set" of features whose ranks do not change a great deal, and uses those to define a normalization curve.

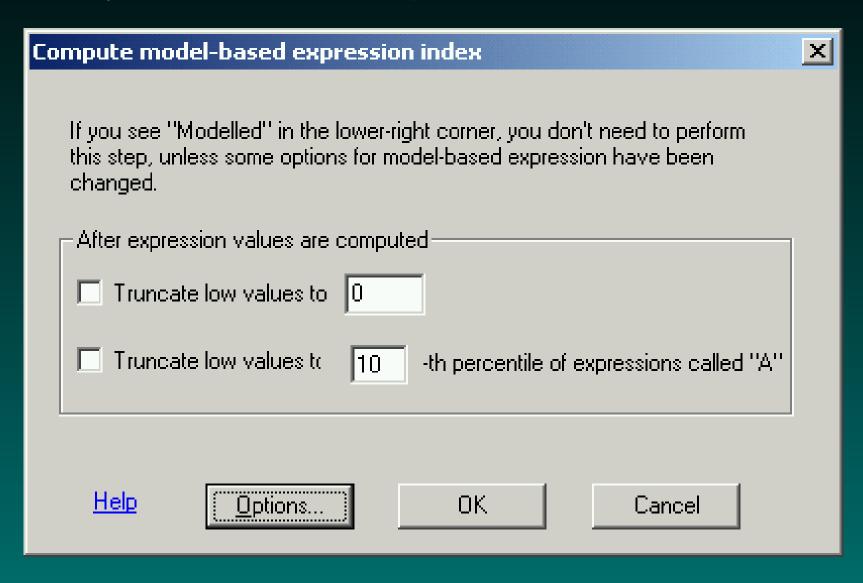

Functionally, this often works like quantile normalization to the target chip.

#### Is it normalized?

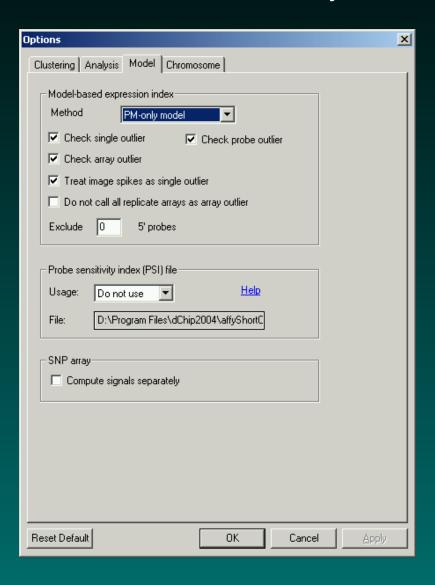

#### Fit the Model 1

#### go to Analysis/Model-based Expression

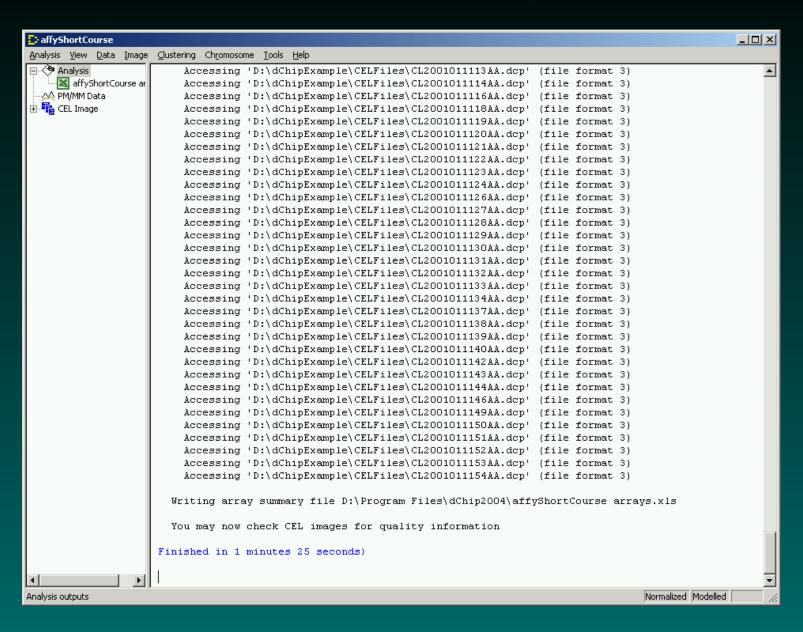

#### Fit the Model 2

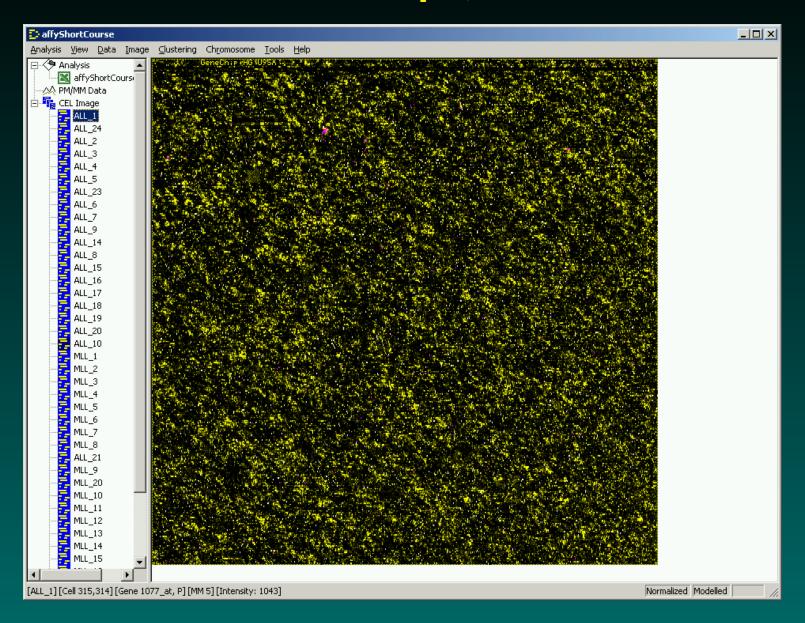

#### Choose "Options" and select the PM-only model

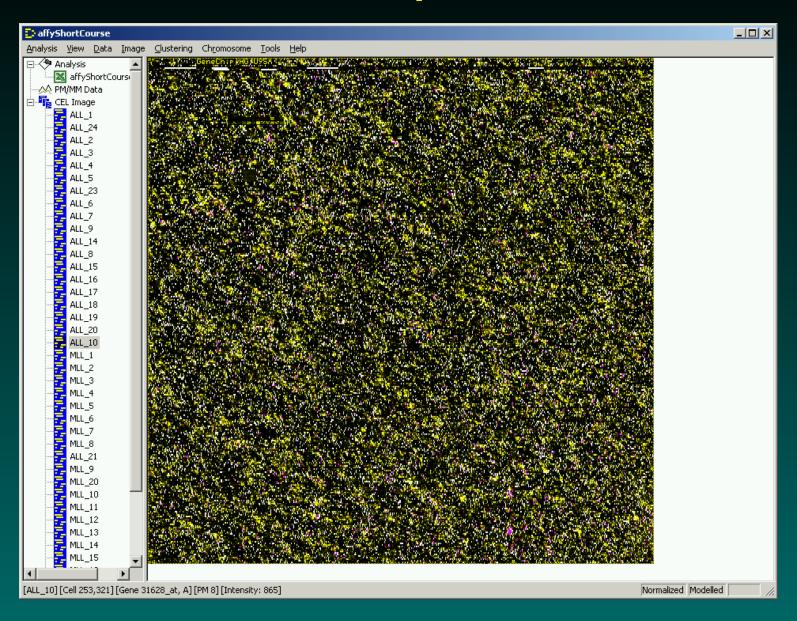

#### Fit the Model 3

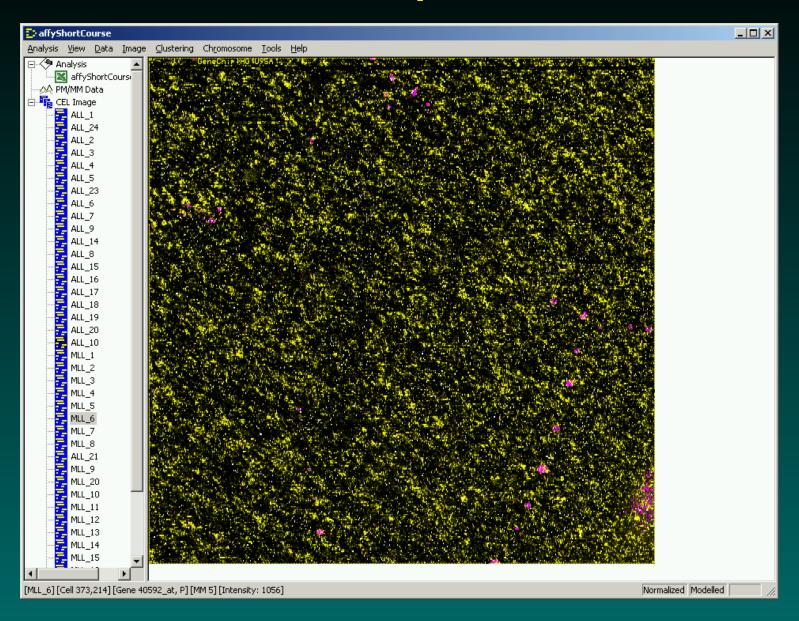

# Look at the Chips, with Cues

# Look at the Chips, with Cues

# Look at the Chips, with Cues

## Residual Checking is Useful

Hitting the "o" key toggles the display of outliers, which can let us look at the values underneath to see if we can spot what the model is picking up.

The file

affyShortCourse.xls

has been updated in the model-fitting process to record the number of "array outliers" (high standard errors, in white) and "single outliers" (discounted measurements, in purple). Model fitting is performed in a robust fashion.

## Residual Checking is Useful

The file

affyShortCourse.xls

has been updated in the model-fitting process to record the number of "array outliers" (high standard errors, in white) and "single outliers" (discounted measurements, in purple). Model fitting is performed in a robust fashion.

So, what does a probeset look like?

#### **Look at a Probeset**

#### **Look at a Probeset**

#### Various panels show

- The PM/MM values for this probeset in this array
- A heatmap view of the same thing
- The target PM-MM values or PM-BG values in this array
- The MBEI values, plotted against their standard errors
- The target values, fitted values, and residuals
- The probe sensitivity indices, plotted against their standard errors

outliers are indicated with colored dots.

#### **Look at a Probeset**

Cycling through the different chips can be accomplished using the Page Up or Page Down keys. The arrow keys zoom in and out as before, but this feature is less useful here.

Holding down the Page Down key produces an animation effect, which can also be achieved using Data/Animate.

The samples are sorted in order of increasing MBEI values, so cycling through produces a differential effect.

For the sample in question, there were 2 array outliers, 0 probe outliers, and 0 single outliers. The model explained 95.72% of the variation, and iterative fitting took 5 rounds.

#### **Look at a Probeset**

For the sample in question, there were 2 array outliers, 0 probe outliers, and 0 single outliers. The model explained 95.72% of the variation, and iterative fitting took 5 rounds.

So, which probesets are "interesting"?

Affymetrix Structure 46

## **Find Interesting Genes**

Go to Analysis/Compare Samples

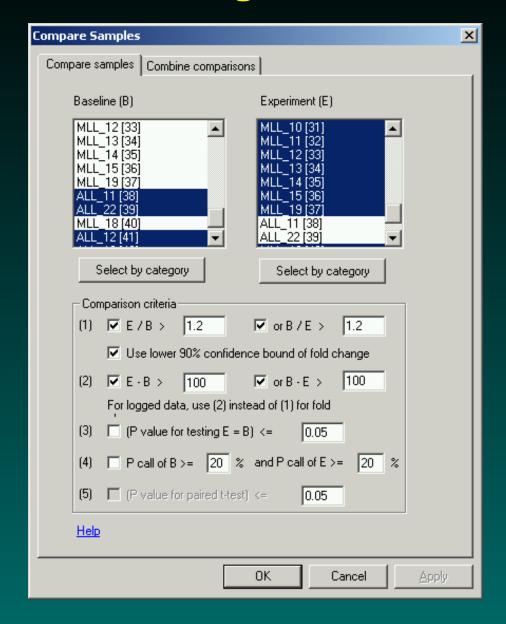

Choose the groups using "Select by Category"; this exploits the information that we supplied in the Sample Info file.

One group is "Baseline", the other "Experiment"

Filter using the lower bound of fold change

Filter on absolute differences

## **Find Interesting Genes: Panel 1**

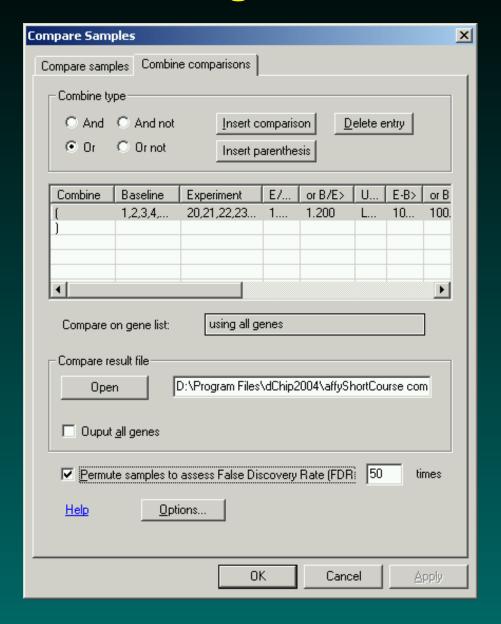

## **Find Interesting Genes**

Look at "Combine Comparisons"

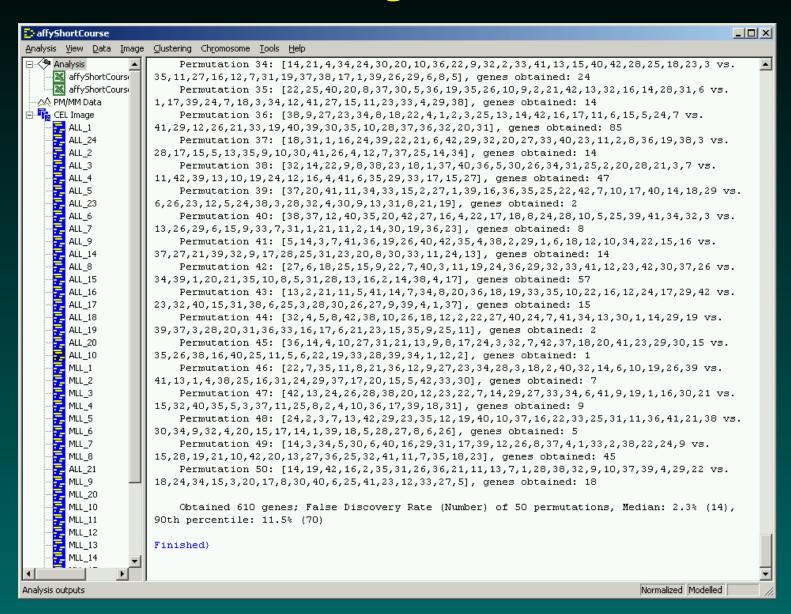

See where the comparison results will be sent

Estimate FDR using permutations

## **Find Interesting Genes: Panel 2**

## Find Interesting Genes – Voila!

## **Find Interesting Genes**

# So, Did We Find What They Did?

Well...

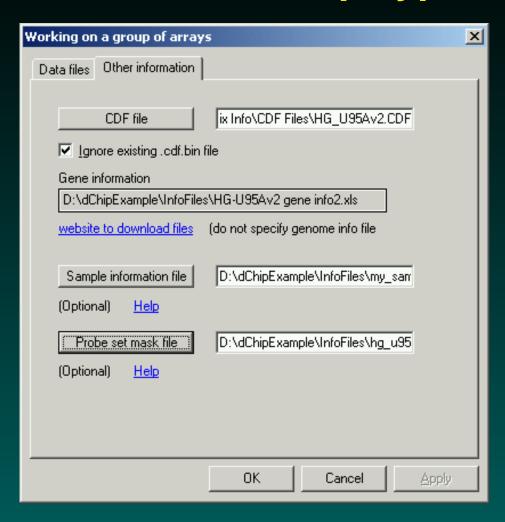

Affymetrix Structure 62

# So, Did We Find What They Did?

Well...

It turns out that half of the chips used were U95A, and the rest (including all of the AML samples) were U95Av2. By default, dChip does not combine results from different chip types. However, since the difference is not large (25 probesets out of 12625), we can mask the ones that don't overlap and get it to fit anyway.

## **Combine the Chip Types**

the mask file is from the dChip web site, and we use the U95Av2 CDF file.

# Do We Find What They Did Now?

Well...

## Do We Find What They Did Now?

Well...

It turns out that the paper reported gene names and gene symbols, but did not specify the Affymetrix probe ids.
Unfortunately, some of the annotation has changed over time.

If we look for

J03779 (gene accession number), aka CD10 (gene symbol)

in the expression tables supplied with the paper, it's not there.

Affymetrix Structure 64

## Do We Find What They Did Now?

Well...

It turns out that the paper reported gene names and gene symbols, but did not specify the Affymetrix probe ids.
Unfortunately, some of the annotation has changed over time.

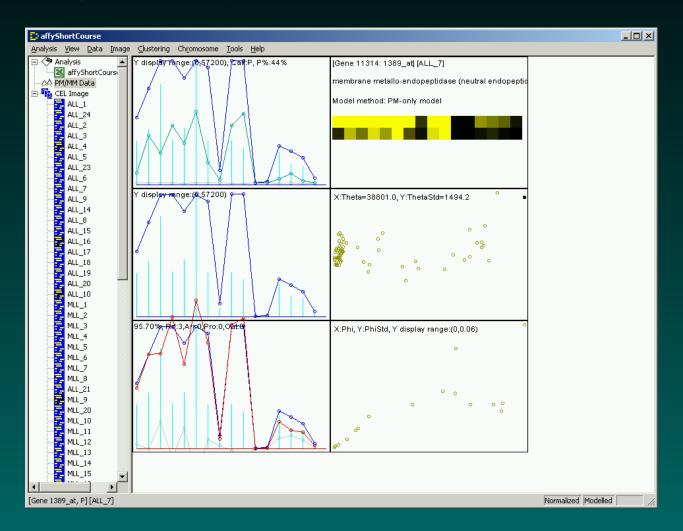

If we look for

J03779 (gene accession number), aka CD10 (gene symbol)

in the expression tables supplied with the paper, it's not there. But if we look in the gene info files supplied with dChip, it *is* there (it's 1389\_at).

#### And?

FC: -3.97, CI: (-3.38,-4.6), Diff: -17310. Different!

## **Summary**

We know what files to track down

We know how to load them in for processing

We know how to normalize and fit models

We know how to export results

We've seen how finicky indexing can be.

## **Summary**

We know what files to track down

We know how to load them in for processing

We know how to normalize and fit models

We know how to export results

We've seen how finicky indexing can be.

And we struck biology!

Thus endeth the lesson...
